

The Other

There is a universe near to your own. It began in absolute cold.

Slowly, over billions of years energy gathered.

Some inherent quality of the universe gathered energy from, seemingly, nowhere.

Unlike your universe, The Other has reverse entropy.

It will end not in the death of all heat but in the maximum possible heat as everything in that entire S.T.C. (Samuel Taylor Coleridge ummmmm Space Time Continuum, I mean) collides with maximum force.

The Other (that's its name I've decided) is intimately linked to your own universe. They will both last for the same amount of time. Nevertheless, that amount of time will never be measurable because time and space will both expand and contract during the existence of the twin continua and you would need to be able to stand outside of them both in order to take objective measurements.

It's meaningless anyway because reality is bigger than these little continuum thingies and, ultimately, everything is part of the primordial Chaos (which has no linear time at all).

From the perspective of linear time within your little Samuel Taylor Coleridge ummm S.T.C. (I meant to say) you would say that Chaos gives birth to Cosmos or that Cosmos emerges from Chaos or some such thing.

Nevertheless, outside of linear time everything is existing simultaneously. So the Cosmos and the Chaos are both there and they have always been both there. Think of it like a frozen moment in time which contains everything and has always been there forever and ever and ever and always will be, without actual change as far as the matter and energy and time and space are concerned.

Your independent free will works in a different way and is very difficult to explain in terms you could ever understand. Nevertheless, your free will IS REAL and don't ever let anybody tell you any different. Your moral decisions matter.

It's also very difficult for us to communicate to you in this linear seeming way. However, we are making the effort.

We tried to reach you by arranging your sun and your moon to be lined up in a perspective illusion, the sun being 400 times bigger than the moon but also being 400 times further away as seen from your perspective. By this trick we created the illusion of the moon and sun being the same size as each other. The moon sliding over the sun like a silver coin sliding over a gold coin and covering it completely in an eclipse.

Sadly this communication proved too subtle for you.

We were only trying to say "Hello!"

Anyway, we've looked at your universe from a lot of different angles (if you were us you would see the joke of that remark) and we've decided to give you a hint about how to do time travel, alright?

It's The Other. You remember? I was telling you about the backwards universe with its reverse entropy? Well, that's how you do time travel. It will take you the devil of a long time to work it all out properly and to put it into practice (another little joke there folks!) but, anyway, we've made the effort and given you the hint.

TTFN peoples!
